SMARTFuel Fuel Management System Overview

The SMART Way to Refuel

The SMARTFuel System is an easily integrated RFID Fuel Management System (FMS) that enables fleet managers to better monitor and control their biodiesel vehicles.

The system consists of RFID-equipped components that enable communication and interaction between vehicles, fuel dispensers, controllers, and data servers. Managers oversee all of this data, and are given measured information about fuel costs, consumption, and emissions reduction while using 100% biodiesel.

Seamless Integration

Gas Nozzle and Vehicles are equipped with RFID Sensors.

RFID Vehicle and Fuel Nozzle Tags allow automated vehicle identification and are programmable with specific fuel type requirements.

A Personalized Solution

Fuel Dispenser and SMARTFUEL Controller authorize fueling and transmit fleet data.

A programmable base station relays data picked up by Nozzle or Vehicle Units to activate/deactivate fuel dispersion based on FMS authorization.

A New Way to Monitor Your Fleet

The Optimus Server collects all data for Fleet Managers to review and analyze.

The intelligent system relays fleet information to an Optimus server to track locations, fuel usage, emissions reductions, and more.

Discover How the SMARTFuel System Can Benefit Your Fleet

How D.C. Public Works Made the Transition to Sustainable Biodiesel

When Fleet Managers in Washington D.C. needed to cut emissions, they sought out the Optimus Vector Fuel System, which enabled their trucks to run 100%, clean-burning biodiesel. With the systems installed, D.C. Public Works then needed a reliable, on-site fueling station that would make the transition to sustainable biofuel as simple as possible. Optimus offered a total fuel solution with the SMARTFuel RFID management system.

The SMARTFuel System ensures a reliable, dedicated fuel supply for a fleet. This comes with no impact to day-to-day operations, as drivers simply pull up and fuel as normal. Behind the scenes, a sophisticated system ensures proper, authorized fueling while tracking key data points.

With Biodiesel and the SMARTFuel System, D.C. has reduced total emissions by 86% and prevented 1,598 tons of carbon from entering the atmosphere

- Monitor and Control Fleet Fuel Costs
- Ensure Accurate Billing
- Authorize Unique Vehicles to Dispense Fuel
- Receive and Track Emissions Reduction Data
